

Operations Quick Start

Field · Value

Document ID · DOC-008-OP

Version · 0.8.0-draft.1

Product version · v0.8.0 target; accepted behavior through v0.7.0

Status · Draft

Owner · Operations Lead

Classification · Confidential — VirtCruise Internal Operations

Last reviewed · 2026-08-03

Purpose

Run safe daily checks, coordinate queues and notifications, manage incidents, and hand over unresolved work without changing authoritative state directly.

Who should use this guide

Operations staff and supervisors using approved monitoring and operational sources. No distinct released Operations role route is established in v0.7.0 evidence; access is policy dependent.

Important: This guide does not replace DOC-002 through DOC-007, DOC-009, or DOC-010. Use DOC-003 for full procedures and DOC-007 for lifecycle meaning.

Daily workflow

Morning control check → Queue/exception triage → Coordinate owners
→ Monitor Financial/booking/notification consequences → Incident response
→ Reconcile and end-of-day handover

Top 10 tasks

1. **Complete morning controls.** Check approved service health, handovers, travel-imminent work, review/Financial exceptions, integrations, projections, notifications, proof storage, and known incidents.
2. **Triage queues.** Distinguish lifecycle state from unassigned, assigned, overdue, retry, failed, stale, quarantined, or manual-intervention queue conditions.
3. **Confirm ownership.** Assign or route work only through approved controls. A queue item without a role owner is an escalation need, not permission to act outside authority.
4. **Monitor review consequences.** Compare review, proof, Payment, allocation, Receipt, Ledger, booking, and notification records separately; never infer one from another.
5. **Monitor notifications.** Check authoritative intent/attempt state through approved monitoring. Do not resend uncertain messages or bypass SUPPRESSED.
6. **Handle booking progression exceptions.** Verify Financial outcomes and booking policy, preserve status history, then route projection failures. Never force CONFIRMED.
7. **Open an incident.** Record UTC start, scope, customer/financial/travel impact, safe symptoms, affected capability, current states, references, and initial owner.
8. **Coordinate response.** Protect customers/data, pause unsafe work, issue only approved service wording, track decisions/owners, and avoid speculative diagnosis.
9. **Escalate by domain.** Finance owns Financial decisions; Security/Privacy owns exposure/malware; Technical Operations owns service/integration recovery; Management owns serious business decisions.
10. **Close or hand over.** Verify authoritative recovery, reconcile related records, confirm communications, record residual risk and next check, and obtain owner acknowledgement.

Quick checklist

Start-of-day checklist

- ☐ Read prior handover and confirm monitoring/escalation routes.
- ☐ Check service, queue, proof, integration, projection, notification, reconciliation, and travel risks.
- ☐ Assign a named owner and next check to every material exception.

Top task checklist

- ☐ Identify owning object, state, queue condition, impact, and exact reference.
- ☐ Refresh; compare related authoritative records separately.
- ☐ Apply only your authorised procedure and retry limit.
- ☐ Escalate with safe evidence and obtain acknowledgement.
- ☐ Verify outcome, audit trail, customer communication, and residual risk.

End-of-day checklist

- ☐ Reconcile completed work and unresolved downstream exceptions.
- ☐ Hand over open incidents, manual interventions, overdue/travel-imminent work, and next checks.
- ☐ Confirm customer updates have an owner; secure records and sign out.

Common mistakes

- Treating queue labels or dashboard totals as business lifecycle state.
- Replaying integration/notification work or approving a case to "unstick" processing.
- Editing a booking/Financial record instead of resolving the owning workflow.
- Declaring recovery before authoritative records, monitoring, and customer impact agree.

Do's and don'ts

Things you should always do

- Preserve current state, safe references, time, impact, decisions, and named ownership.
- Use approved incident wording and minimum necessary information.

- Verify recovery end to end across the affected authoritative records.

Things you must never do

- Share proof, secrets, customer data, internal recipient lists, or speculative causes broadly.
- Bypass Finance, Security/Privacy, access, audit, or lifecycle controls.
- Invent severity, service levels, retry limits, thresholds, or recovery commands.

Escalation

Issue · Owner · Escalate when · Do not escalate when

Review/Financial decision · Finance Supervisor · Decision authority, mismatch, duplicate, reconciliation, or policy issue · Normal eligible Finance work has an owner

Service/integration/projection · Technical Operations · Automation stops, repeats, conflicts, or exceeds approved window · Normal processing is observable within policy

Notification · Notification Operations · Failed, uncertain, suppressed-policy question, or manual intervention · Valid pending/retry state is within policy

Privacy/security/proof safety · Security/Privacy · Immediately on exposure, compromise, malware, or unsafe proof · Proof is simply awaiting accepted scanning

Customer/travel impact · Support/Operations Manager · Coordinated customer update or urgent travel decision is needed · The normal owner and approved wording suffice

DOC-003 is the primary operating procedure; DOC-004 controls Financial approval/reconciliation. Escalation supplements ownership—it does not transfer responsibility silently.
